

Some explanation:

Old Canon T5 with F/8 500mm cata-dioptic. Except during totality Orion solar filter. A Mohawk old tripod. I found the sun with the mirror down and filter off. I finally learned to use the whole detector instead of center weighted, as it was very difficult to center the image. Also many tries to set the exposure metering. Finally, I have a neck ache from the sun's altitude so high. A small mirror would have made it much easier, or better the cable connected to my computer.

My overdose of diuretic made me sick after totality, so missed the last few minutes. The last image is a few mins. after last contact.
